nbtscan Cheat Sheet ∞

CHEAT-SHEET 29 Mar 2015  Arr0way

nbtscan is a command line tool that finds exposed NETBIOS nameservers, it's a good first step for finding open shares.

★ **Don't use the version of nbtscan that ships with KALI**
Grab nbtscan from the above link and build it from source, this version tends to find more information

Compile nbtscan on KALI

```
root@kali:~/nbtscan# wget http://www.unixwiz.net/tools/nbtscan-sourc
root@kali:~/nbtscan# tar -xvzf nbtscan-source-1.0.35.tgz
root@kali:~/nbtscan# make
root@kali:~/nbtscan# ./nbtscan
nbtscan 1.0.35 - 2008-04-08 - http://www.unixwiz.net/tools/

usage: ./nbtscan [options] target [targets...]

   Targets are lists of IP addresses, DNS names, or address
   ranges. Ranges can be in /nbits notation ("192.168.12.0/24")
   or with a range in the last octet ("192.168.12.64-97")
```

`nbtscan -H`	Generate an HTTP header

`nbtscan -V`	Enable verbose mode
`nbtscan -n`	Turns off this inverse name lookup, for hanging resolution
`nbtscan -p PORT target(s)`	This allows specification of a UDP port number to be used as the source in sending a query
`nbtscan -m`	Include the MAC (aka "Ethernet") addresses in the response, which is already implied by the -f option.
